#### DETAILED ACTION

## Claim Objections

Claim 8 is objected to because it is improperly dependent on claim 9. For the consideration of prior art, claim 8 was treated as being dependent on claim 1. This objection may be overcome by amending claim 8 to read, "The method of claim 1, wherein...".

### Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-3, 6, 7-10, 13-17, 20-24, 27-31, 34-48 and 41 are rejected under 35 U.S.C. 102(e) as being anticipated by Kacyra et al. (US Patent 6,619,406).

Kacyra et al. describes what is disclosed in claims 1, 9, 15, 23, 29 and 37 in column 1 lines 66-67 and column 2 lines 1-5 where it is stated that several points are gathered to generate a model of an object within an area of interest. Kacyra et al. also describes in column 3 lines 3-6 that gathered points that are identified to have similarities to particular object. The volume and surface data of the objects are then generated using the collected points for that object, as described in column 2 lines 32 –34, which is equivalent to the generation of an isosurface. Kacyra et al. describes the generation of the reversed orientation visualization model in column 3 lines 3-6 as an obtained group of points that corresponds and identifies with a particular object of

Art Unit: 2671

interest within an area. It is therefore possible to also generate only the points that comprise the object, which would result in the exclusion of obscurities. The limitation of claim 9, which describes the selection of a region of interest for observation, is illustrated by element 514 of Figure 5 and is also described in column 7 lines 50-52.

Kacyra et al. explains gathering point data over an area of land in which their position is defined by elevation measures which supports the detection of points from an aerial position in column 2 lines 34-40, which is disclosed in claims 2, 9, 16, 23, 30, and 37. Kacyra et al. also describes the limitations of claims 3, 10, 17, 24, 31, and 38 in column 1 lines 12-14, where it is stated that the three dimensional imaging data of the scene obtained using a 3D lidar system which is equivalent to a ladar system, and is also illustrated as element 412 in Figure 4.

Kacrya et al. describes what is disclosed in claims 6, 13, 20, 27, and 34 in column 7 lines 46-51, where it is stated that regions of interest are selected which are then used to generate images using the collected data points, one of which can be used for generating a reversed image excluding any obstructions by generating only the points comprising the object of interest.

The limitations of claims 7, 21, 28 and 35 are described by Kacyra et al. in column 3 lines 9-11 where it is described that obtained points are used to generate models which contain several features relating to objects of interest over a particular land area that may be referenced or extracted, as described in column 3 lines 11-14, which can then be used to either produce a model of all objects that comprise the surfaces encompassing the area of terrain under analysis equivalent to a top down visualization, or a specific group of points corresponding to a captured object of interest excluding all obscurations would also be illustrated using a visual representation which would present a view from the ground level up.

Art Unit: 2671

Kacyra et al. describes what is disclosed in claims 8, 14, 22, 28, 36 and 41 in column 2 lines 34-38 where it is stated that the a group of points are obtained over a tract or area of land to define a model over a particular surface. The generated model is described to have referencing capabilities in column 3 lines 11-14. Therefore total ground occlusion, which displays the object in the absence of obstruction, would be achieved by referencing only those captured points that define the object of interest.

It is also evident from the teachings of Kacyra et al. that the method for detection of an object from an aerial position in a three dimensional point cloud representing an area where the object may be obscured, as described in the preamble of claims 1 and 9, is described in column 1 lines 11-14 and column 3 lines 1-6, where the detection of an object using a laser is used to gather points that are compared to identified objects, which enables independent generation thereby excluding obscurations. A system and computer readable medium for storing the model and other data pertaining to the object of inertest, is explained in column 9 lines 6-22, which is also implied to comprise stored instructions, image processing and a laser detection apparatus for facilitating the detection of the model as well, as described in the preamble of claims 15, 23, 29 and 37.

## Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary

Art Unit: 2671

skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 4, 5, 11, 12, 18, 19, 25, 26, 32, 33, 39 and 40 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kacrya et al. in view of Foley et al., in further view of Valle et al.

Kacrya et al. teaches what is disclosed in claims 4, 5, 11, 12, 18, 19, 25, 26, 32, 33, 39 and 40 except the method of computing a mesh using a fast binning method and the computation of the isosurface of the object using a marching cubes method. Foley et al. teaches generating an isosurface using a marching cubes method on page 1048. The method of generating a mesh using a binning method is known in the art, and is described by Valle et al. on page 1 in lines 1-2 of the synopsis section, and lines 1-5 of the description section. It would have been obvious to one of ordinary skill in the art to combine the teachings of Kacyra et al. and combine them with the marching cube method of Foley et al. and the binning method of Valle et al. because both methods improve the generation of the surfaces of the mesh data from an obtained group of data points to display 3D views of areas of interest that may contain areas of occlusion.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Said Broome whose telephone number is (571) 272-2931. The examiner can normally be reached between 8:30am-5pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Ulka Chauhan can be reached on (571) 272-7782. The fax phone number for the organization where this application or proceeding is assigned is (571) 272-8300.
